                                                           NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence. It currently consists of 51 contigs. The true order of the places is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          * NOTE: This record contains 84 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low-pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that

the record is updated, the accession number will

* be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   f 701 bp in length

```
The present invention relates to tubedown-1 (tbdn-1) proteins and tetrace therefore the proteins having anti-anglogenic their corresponding cDNAs. Tbdn-1 proteins having anti-anglogenic activity are associated with acetyl transferase activity. They correct the activity are associated with acetyl transferase activity. They can be binding or by interacting with and/or acetylating other protein contents important for endothellal differentiation. In normal adult transpersed highly in the corneal endothelium proper and in the vascular endothellum of the limbus and retina. Tbdn-1 and in the vascular endothellum of the limbus and retina. Tbdn-1 proteins are useful for preventing, treating, inhibiting or delaying proteins are useful for preventing, treating, inhibiting or delaying reconsected and proteins are also useful diabetic retinopathy or retinopathy of prematurity, or primary diabetic retinopathy or retinopathy of prematurity, or primary diabetic retinopathy or retinopathy of prematurity, or primary or primary stroke, haemorrhagic shock, architis, or treating any pathological neovascularisation conditions are also useful for treating ocular neovascularisation, the invention are also useful for solid tumour growth. Proteins of the invention are also useful for solid tumour growth. Proteins of the invention are also useful for solid tumour growth. Proteins of the invention are also useful for unveitis, neovascularisation of the optic nerve. Sequences of the invention are also used in gene therapy. The present sequence is invention are also used in gene therapy. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel tubedown-1 protein comprising anti-angiogenic activity is for treating angiogenesis-associated disease related to ocular neovascularization, e.g., diabetic retinopathy, retinopathy of

                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence represents a new human gene, tubedown-1 (tbdn-1). The invention relates to a novel isolated nucleic acid of the tubedown-1 gene, and antisense nucleic acids to tbdn-1. The polynucleotides and protein of the invention have eytostatic and osteopathic activity. The polynucleotides of the invention may be used in antisense-therapy/gene polynucleotides of the invention may be used in antisense-therapy/gene therapy. They are useful in the treatment of bone tumcurs, especially osteosarcoma and Ewings sarcoma family of tumcurs. The compounds of the invention may also be useful for the prevention of metastases from these therether alone or in combination with radiotherapy and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 180

```
The sequence represents tubedown-1 (tbdn-1) bases 3418-1 antisense cDNA. The invention relates to a novel isolated nucleic acid of the tubedown-1 gene, and antisense nucleic acids to tbdn-1. The polynucleotides and protein of the invention have cytostatic and osteopathic activity. The polynucleotides of the invention may be used in antisense-therapy/gene therapy. They are useful in the treatment of bone tumours, especially osteosarcoma and Ewings sarcoma family of tumours, rhe compounds of the invention may also be useful for the prevention of metastases from these types of tumours, either alone or in combination with radiotherapy and/or chemotherapeutic agents.
                                                                                                                                                                                                                                                                                                                        Nucleic acid molecules antisense to the tubedown-1 gene prevent overexpression of tubedown-1 protein and are useful to treat osteosarcoma and Ewing's Sarcoma family of tumours
                                                           osteopathic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Indels

Tang YT;

Liu C,

2001WO-US08631 2000US-0540217 2000US-0649167 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polymerase chair also used in diagnostics as expressed sequence tags polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques of consideration of (II). (II) is useful for generating antibodies against it, detecting or (II). (II) as useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical calsorders involving abereant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations can produce other types of data and products dependent on DNA and amino acid sequences. AASA4197-AASA4544 represent novel human conding sequences of the invention.

The sequence represents tubedown-1 (tbdn-1) bases 1413-1 antisense cDNA. The invention relates to a novel isolated nucleic acid of the tubedown-1 gene, and antisense nucleic acids to tbdn-1. The polynucleotides and protein of the invention have cytostatic and osteopathic activity. The polynucleotides of the invention may be used in antisense-therapy/gene therapy. They are useful in the treatment of bone tumours, especially osteosarcoma and Ewings sarcoma family of tumours. The compounds of the invention may also be useful for the prevention of metastases from these types of tumours, either alone or in combination with radiotherapy and/or chemotherapeutic agents.

The present invention describes primer sets for synthesising 5602 tull-length cDNAs defined in the specification. Where a primer set full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary strand of a polymucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of of an oligonucleotide comprising a sequence complementary to the complementary; strand of a polymucleotide which comprises a 5'-end sequence and an oligonucleotide omprises a 3'-end sequence, where the polymucleotide comprises a 3'-end sequence, where the colligonucleotide comprises a 3'-end sequence complementary to a sequence and an oligonucleotide sequence is selected from those defined in the specification. The primers also used in antisense therapy and the specification. The primers are useful for synthesising polymucleotides, in gene therapy. The primers are useful for synthesising polymucleotides, in gene therapy. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length the full-length cDNAs. The primers allow obtaining of AH13618 and AAH13613 to AAH13613 t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss.

The present invention describes primer sets for synthesising 5602 comprises: (a) an oligo-dT primer and an oligouncleotide complementary comprises: (a) an oligo-dT primer and an oligouncleotide comprises one of the complementary strand of a polynucleotide which comprises one of cligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 15'-end sequence of sequence complementary to a polynucleotide comprision and the combination of the specification. The primers also a sequence, where the compined in the primers are useful for synthesising polynucleotides, in gene therapy. The primers are useful for synthesising polynucleotides, complementary full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length without any specialised methods. ABH13618 to AAH13631 to AAH13631 to AAH13631 to AAH13632 to AAH36310 to AAH13632 and the present human amino acid sequences; and AAH13632 to AAH13632 the present invention. SSSSSSSSSSSSSSSSSSSSSSS

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dry primer and an oligonuclectide comprises it to the complementary strand of a polynuclectide which comprises one of oligonuclectide comprises at least 15 nuclectides; or (b) a combination of an oligonuclectide comprising a sequence complementary to the complementary strand of a polynuclectide which comprises a 5'-end sequence and an oligonuclectide comprises a 3'-end sequence complementary to a polynuclectide comprises a 3'-end sequence where the combination of complementary strand of a polynuclectide comprises a 3'-end sequence complementary to a polynuclectide comprises a 1'-end sequence where the combination of the specification. The primer sets can be used in antisense therapy and comprises are useful for synthesising polynuclectides, complementary to a polynuclectide comprises are useful for synthesising polynuclectides, complementary that the primers are useful for synthesising polynuclectides, complementary full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by complementary strand any specialised methods. AAH13613 to AAH13629 to AAH13632 complementary complementary complementary thuman amino acid sequences; and AAH13620 to AAH13632 complementary complementar the present invention.

This invention describes a nucleic acid (I) with differential expression between tumour and normal cells and which has cytostatic activity. (I) between tumour and normal cells and which has cytostatic activity. (I) between tumour speeced of the conformal conformal conformal conformal conformal conformal conformal compound (potential pharmaceutical) on a cell line, particularly for diagnosis and treatment of tumors, especially by particularly for diagnosis and treatment of tumors, especially by conformal conformation of (I) (by gene therapy, antisense RNA or ribozyme methods) or by modulating the amount and/or location of (I)-encoded polypeptides (by administration of the polypeptide or its activator, antibody (optionally as a conjugate) or inhibitor). The method allows are not primary targets for tumour suppressor genes (i.e. genes that the number and reat derived nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids differentially expressed between tumor and normal cells, useful for diagnosis or therapy of tumors and for screening active agents
                                                                                                                                                               Differential transcription; human; rat; tumour cell; cytostatic;

full-length cDNAs -

XX

Claim 1; SEQ ID 3324; 2537pp + CD ROM; English.

XX

The present invention describes primer sets for synthesising 5602

Cdull-length cDNAs defined in the specification. Where a primer set

CC full-length cDNAs defined in the specification. Where a primer set

CC comprises: (a) an oligo-dr primer and an oligouncleotide comprementary strand of a polynucleotide which comprises one of

CC oligonucleotide sequences defined in the specification, where the

CC on oligonucleotide comprision a sequence complementary to the

CC onplementary strand of a polynucleotide which comprises a 5'-end

Sequence and an oligonucleotide comprision a sequence complementary to a

CC polynucleotide which comprises a 1'-end sequence complementary to a

CC polynucleotide comprises a 1'-end sequence complementary to a

CC polynucleotide comprises a 1'-end sequence on the combination of

CC polynucleotide comprises a 1'-end sequence on those defined in

CC the 5'-end sequence/3'-end sequence is selected from those defined in

CC the 5'-end sequence/3'-end sequence is selected from those defined in

CC the 5'-end sequence/3'-end sequence is selected from those defined in

CC the specification. The primers are also obtaining of the proteins encoded by

CC the full-length cDNAs. The primers are also useful for the

CC the full-length cDNAs. The primers are also obtaining of the full-length

CC AAB13633 to AAH13631 to AAH13632 to AAH13632

CC AAH13633 to AAH13632 to PAH13632

CC AAB5893 represent human amino acid sequences; and AAH13632 to AAH13632

CC Tepresent oligonucleotides, all of which are used in the exemplification

XX

Sequence 790 BP; 250 A; 136 C; 155 G; 246 T; 3 other;

The polynucleotides of the invention are represented in AAX98275-X93118 and encode polypeptides of protein families selected from 4 transmembrane segments integral membrane

proteins, 7 transmembrane receptors, ATPases associated with various cellular activities (AAA), eukaryotic aspartyl proteases, GATA family of transcription factors. G-protein alpha subunit, photoblesters or diacylglycerol binding proteins, protein kinase, protein phosphatase 2C, protein tyrosine phosphatase, trypsin, wnt family of developmental corrections and WM.rsp5/WWP domain containing proteins. The signalling proteins also have a functional domain selected from Ank corrected bollypeptides also have a functional domain selected from Ank corrected basic region plus leucine Zipper transcription factors, repeat, basic region plus leucine Zipper transcription factors, cromedomain, EF-hand, SH3 domain, WD domain/G-beta repeats, Zinc finger (CCHZ class), and Zinc-binding metalloprotease (C2HZ type), zinc finger (CCHC class), and zinc-binding metalloprotease correctin families and are preddicted to have similar properties. The novel protein families and are preddicted to have similar properties. The novel products for use as therapeutic agents and in forensics, genetic analysis, mapping and diagnostic applications. In particular, the product can be used for the detection and management of cancers. They can be used for treating e.g. cervical cancers, mplanearicoms, lung carcinomas, wilm's tumour, sarcomas, cancers, mplanearicoms, lung carcinomas, leukemias, such as chronic myeloid leukemia, and lymphomas such as histiccytic lymphoma, and management dysplasia, congenital alveolar dysplasia, and mammary dysplasia of the cervix, fibrous dysplasia of bone, and mammary dysplasia, of the cervix, fibrous dysplasia of perostate or thyroid hyperplasias, or pseudoephitalionatous hyperplasia of the cervix, fibrous dysplasia of prostein ammary dysplasia or pseudoephitalionatous hyperplasia of perostate or pseudoephitalionatous hyperplasia or pseudoephitalionatous peutomas or pseudo the skin. \$

The present invention describes a library of human polynucleotides comprising the sequences given in AA212532 to AA21779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AA212532 to AA217779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, amphing, tissue typing or profilling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and

therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer). The polynucleotides of the invention are especially used in the and lung cancer. The polynucleotides can also be used to screen for peptide analogues and antagonists.

New isolated human polynucleotides

Claim 1; Page 564; 591pp; English.

This invention describes novel isolated human polynucleotides obtained by screening for differential expression in colon cancer, breast cancer call lines: The polynucleotides of the invention are and lung cancer call lines: The polynucleotides of the invention are represented in AAX88275-x99118 and encode polypeptides of protein crepted from 4 transmembrane segments integral membrane proteins, 7 transmembrane receptors, APPases associated with various continual activities (AAA), eukaryotic aspartyl proteases, GATA family of transcription factors, G-protein alpha subunit, phorobolasters or calcular activities (AAA), eukaryotic aspartyl proteasters or diacyllypercoil binding proteins, protein kinase, protein phosphatase 2C, protein tyrosine phosphatase, trypsin, wnt family of developmental conceed polypeptides also have a functional domain selected from Ank repeat, basic region plus leucine zipper transcription factors, comedomain, EP-hand, SH3 domain, WD domain/G-beta repeats, zinc finger (CCHC class), and zinc-binding metalloprotease domain. The polynucleotides encode polypeptides with similarity to known protein families and are predicted to have similar properties. The novel polynucleotides can be used to develop products for use as therapeutic agenications. In particular, the product can be used for the detection and management of cancers. They can be used for treating and diagnostic cancers, melanomas, colorectal adenocarcinomas, Nilm's tumour, sarcomas, retinoblastoma, myosarcomas, lung carcinomas, leukemia, and lymphomas such as histlocytic lymphoma, and lymphomas such as histlocytic lymphoma, and competed of percental diagnostic land myslasia, and lymphomas such as histlocytic lymphoma, and mamary dysplasia of the cervix, fibrous dysplasia of mammary dysplasia, encourable of the cervix, fibrous dysplasia of the servix, fibrous dysplasia of the servix, fibrous dysplasia of the servix fibrous cancers.

The present invention describes a library of human polynucleotides

C comprising the sequences given in AAZ12532 to AAZ1779. Also described is

C comperious state of a mammalian cell, comprising detecting at least one

cancerous state of a mammalian cell, comprising detecting at least one

differentially expressed gene product in a test sample from a cell

cuspected of being cancerous, where the gene product is encoded by one

cuspected of being cancerous, where the gene product is encoded by one

of the 5248 polynucleotide sequences given in AAZ1233 to AAZ1779. The

cof the 15248 polynucleotide sequences given in AAZ1533 to AAZ17779. The

polynucleotides can be used as a source of primers and probes, which can

company tissue typing or profiling, forensics, genetic analysis and

detection of polymorphisms. Polypeptides encoded by the polynucleotides

can be used for raising antibodies for experimental, diagnostic and

therapeutic purposes. The polynucleotides may also be used to construct

therapeutic purposes. The polynucleotides may also be used to construct

two cells (e.g. to identify abnormal or diseased tissue in a human, to

two cells (e.g. to identify abnormal or diseased tissue in a human, to

cancer). The polynucleotides of the invention are especially used in the

cancer). The polynucleotides of the invention are especially used in the

cancer. The polynucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     184

This invention describes nove taborate on numen polymorgeotiaes obtained by screening for differential expression in colon cancer, breast cancer and lung cancer cell lines. The polymorlectides of the invention are represented in AAX82575.59118 and encode polypeptides of protein families selected from 4 transmembrane segments integral membrane proteins, 7 transmembrane receptors, ATPasses associated with various cellular activities (AAA), eukaryotic aspartyl proteases, GATA family of transcription factors, G-protein lipha submilt, phorbolesters or diacylglycerol binding proteins, protein kinase, protein phosphatase 2C, concoded polypeptides also have a functional domain selected from Ank crepeat, basic regions. The encoded polypeptides also have a functional domain selected from Ank crepeat, basic regions. The monor of commodomain, EF-hand, SH3 domain, WD domain/G-beta repeats, 2nc finger (C2H2 type), zinc finger (CCC class), and zinc-binding metalloprotease of comming the polymorlectides encode polypeptides with similarity to known protein families and are predicted to have shimlar properties. The novel polynoclectides can be used to develop products for use as therapeutic agents and in forensics, genetic analysis, mapping and diagnostic capenics and in forensics, genetic analysis, mapping and diagnostic cancers, melanomas, colorectal adenocarcinomas, Halm's tumour, sarcomas, cretinoblastoma, myosarcomas, lung carcinomas, Halm's tumour, sarcomas, myosarcomas, ung carcinomas, Halm's tumour, myosarcomas, ung carcinomas, leukemias, and mydric hereditary ectodermal dysplasia, congenital alveolar dysplasia, of the cervix, fibrous dysplasia of the skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4

```

```
This invention relates to a method for generating a signal indicative of the presence of a target nucleic acid sequence in a sample. The method comprises the formation of a cleavage structure through the incubation of a sample comprising a target nucleic acid sequence and a nucleic acid polymerase and cleaving the cleavage structure with a 5' exonuclease.l or flap endonuclease (FBN) to generate the signal. The method is used for the detection and quantification of a target nucleic acid sequence. The present sequence represents a PCR primer used to amplify the Pyrococcus furiosus FEN endonuclease gene sequence. The PCR product is used in an example illustrating the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The labelling of nucleic acids for their detection and quantification comprises the formation of a cleavage structure and its cleavage with five' exonuclease-1 or flap endonuclease-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-emb1/NA2001A.DAT:AAF57073
                                                                                                                                                                                                                                                                                                                       target sequence detection; flap endonuclease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             359 AspAspGluGluIleGlyGlyProLysGluGluLeuIleProGluLys 374
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length: 16

```
The invention provides a composition (A) for enhancing nucleic acid polymerase reactions that comprises an archaeal MCM (minichromosome maintenance protein) and at least one of the archaeal polypeptides (PCNA, maintenance protein) and at least one of the archaeal polypeptides (PCNA, PRPC, PD8 or -P55, RPA, CDC6, FENI-, duTPRase, ligase, helicase dna.) or helicases 2-8). (A) And similar compositions containing different combinations of accessory proteins, labeling and detecting reactions, e.g. for gene characterization, cloning, detection of allelic variants, diagnosis and screening for disease, particularly where done by conjunctase chain reaction (PCR). Some of the proteins also stabilize polymerase reactions or improve exonuclease reactions, for example RRA also improves specificity of nucleic acid/protein interaction and PCNA improves polymerase—mediated repair processes and interaction and PCNA improves polymerase—mediated repair processes and hybridization reactions. Nucleic acids encoding the archaeal polypeptides are used for recombinant production of proteins, and fragments of the nucleic acid as probes and primers for screening related sequences. The accessory proteins increase accuracy and efficiency of polymerase reactions, allow use of lower denaturation and extension temperatures (Possibly isothermal processing), and improve synthesis of long targets. Sequences ABFS7041-74 represent PCR primers for amplifying various

The primers AAT47976-9 were used to amplify the sequence encoding the human chymase catalytic domain. A first amplification was carried out using primers AAT47976 and AAT47979. A second amplification was then carried out with primers AAT47979. A second amplification was then carried out with primers AAT47979. Positive transformants were screened by PCR using primers AAT47978-9. The amplifications consisted in a chymase protein which contained the myellin-associated of 1/2 of 1/2 opportein (MAG) and the 8 amino acid FLAG epitope/cleavage site fused to the N-terminus of the chymase catalytic domain. This fusion allows casier purification of the chymase from a mammalian expression system. The chymase portion of the fusion was derived from the wild type gene chymase portion of the fusion was derived from the wild type gene chymase fusion is because chymase produced by itself is proteolytically active so tends to be unstable in the cell. The fusion portion of the protein renders the chymase inactive until it removed by cleavage. The purified chymase can be used to generate chymase-specific antibodies and to identify chymase inhibitors.
                                                                                                                                                                   Wild type; human; chymase; fusion protein; proteolytically; unstable; inactive; cleavage; transition mutation; antibody; inhibitor; primer; PCR; polymerase chain reaction; amplification; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-emb1/NA2000.DAT:AAA08530

Trypsinogen was fused directly to the C-terminus of the alpha factor without a Glu-Ala-Glu-Ala linker peptide. Oligonucleotides AAA06529-30 cenceding a C-terminal portion of the alpha factor signal sequence and the Val(Asp)5 leader sequence were synthesized. The wild type bovine trypsinogen was mutated to destroy the trypsin cleavage site. The lys residue present in the leader sequence of the native bovine trypsinogen was mutated to an Asp residue. The specification claims and soluted trypsinogen analogue comprising a protein having trypsinogen analogue comprising a protein having trypsinogen activity and a leader sequence having at least two amino acids which are not Lys or Argonominantly produced trypsinogen is useful are not Lys or Argonominantly produced trypsinogen is useful content and the characterization of other proteins, and in the manufacture of their recombinant bioproducts, for example to cleave leader sequences from small recombinant proteins expressed initially as fusion proteins. The present method provides for expression of an inactive zymogen form purification from fermentation broth or cell extracts. This is accomplished through the expression of a single chain trypsinogen complished through the expression of a single chain trypsinogen trypsin-like enzyme cleavage site. Specifically the trypsinogen trypsin-like enzyme cleavage site. Specifically the trypsinogen considered the present invention lack a lysine or arginine in the antivation by endougenous host cell enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New trypsinogen analog useful for the production of recombinant trypsin has a modified leader sequence not cleavable by trypsin or trypsin-like
                                                                                                                                        Oligonucleotide encoding C-terminal portion of the alpha factor signal sequence and mutated trypsinogen leader sequence.

Polymorphic nucleic acid sequences, useful in genetic testing and

Claim 1; Page 792; 2653pp; English

therapy

AA173060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).
AAM33114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein thereby, and in vaccine production. (I) and the polypoptides encoded by the used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides.

For example, (I) may be used to frast disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative production of antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the resence of polymorphic polypeptides in samples. Length: 9

```
The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, andiopoietin, capoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinases, colony stimulating factors, complement related corporations, cytochromes, kinasins, cytochromes, interferons, interleukins, cg-protein coupled receptors and thloesterases. The present sequence is cg-protein coupled receptors and thloesterases. The present sequence is cone such oligonucleotide. The oligonucleotides and the peptides encoded cone such oligonucleotide and the prevention of alsones associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include above. Disorders that may be prevented, diagnosed and/or treated include above. Interpretate and accomponent, such as autoimmune cyclemic lupus erythromatosus and Grave's disease), inflammation, cancer cego. cancers of the bladder, brain, breast, colon and kidney,

This invention describes a novel method for identifying agonist or inhibitory antibodies (Ab) to receptors (R) involved in cell survival, continuition, differentiation, or activations. The method is used to proliferation, differentiation, or activations and can identify Ab that are growth factor mimetics and inhibitors and can cegulate growth, differentiation, survival and activity of many continuities, particularly hematopoietic cells (at various different cell types, particularly hematopoietic cells (at various controlipotent (embryonic stem) cells. Ab are used (1) directly as controliferation or differentiation of cells. Ab are used (1) directly as controliferation or differentiation of cells for use in gene therapy, controliferation of differentiation of cells for use in gene therapy, controliferation and sorting, (ii) as diagnostic/research reagents, e.g. conditions such as allergy, (ii) as diagnostic/research reagents, e.g. for cell identification and sorting, (iii) to clone receptors and native factors that they mimic (also potential therapeutic agents). Typical factors that they mimic (also potential therapeutic agents). Typical capability bone marrow transplants, myeloproliferative diseases aplastic anemia, thrombocytopenia or allergy) and inhibitory Ab, cell contained to a toxin, are used to kill cancer cells. The method is not subject to the usual limitations of monoclonal antibody technology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Haematopoietic; growth factor; PCR primer; mimetic; cell survival; cell, proliferation; cell differentiation; cell activation; agonist; growth factor inhibitor; nervous system cell; endodermal cell; therapy; totipotent cell; embryonic stem cell; gene therapy; protection; allergy; diagnostic; neutropenia; leukemia; aplastic anaemia; thrombocytopenia; cancer cell; bone marrow transplant; myeloproliferative disease; antibody; lambda light chain; variable region; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel peptides which home to angiogenic vasculature, specifically of a tumour and which have anti-tumour, anti-inflammatory, anti-angiogenic and anti-arthritic activity. Such molecules are identified by treating a purified NGR receptor with a test compound and identifying compounds that bind specifically to the NGR receptor. The peptides of the invention are inhibitors of angiogenesis and can be used to produce conjugates for delivering agents to
(limited number of cell fusions) and thus makes possible screening of very large immune repertoires, nor is it limited by type of regulator its origin/slite of production. It does not presuppose any blochemical function, sequence similarity or site of origin, and allows rapid, inexpensive and simple screening of many samples simultaneously.

anglogenic vasculature, particularly anticancer drugs or an imaging agent, for diagnosis or prognosis. These conjugates may be directed to non-tumour anglogenic vasculature, e.g. that present in inflammatory, regenerating or wounded tissue, e.g. for treatment of macular degeneration, diabetic retinopathy or rheumatoid arthritis. The peptides provide specific targeting to tumours, especially their supporting vasculature, since the NGR receptor is exposed to the circulation only in anglogenic vasculature. Precise targeting should reduce the systemic toxicity of anticancer drugs in the conjugates. Complete killing of all target cells may not be essential since partial demudation of endothellum may result in an occlusive thrombus, and endothellal cells are unlikely to become resistant to anticancer agents nor to lose the targeting receptor. AAX23730-X23747 and AAX23883 are primers used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   used to construct a high density disequilibrium

                              AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for diseases states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side
                                                                                                                                                                                           effects from pharmaceutical agents acting on a disease as well as other

The invention relates to methods of increasing the hybridization rate between two nucleic acids. One method comprises construction of two nucleic acids and a polyamine, and hybridizing both nucleic acids tegether, under suitable conditions. Also provided is a similar method involving two nucleic acids with RNase H, where both nucleic acids do
The present invention relates to human reverse transcriptase 13 and its coding sequence (see AAH75868 and AAG66428). The reverse transcriptase and its coding sequence are useful in the diagnosis and treatment of malignant tumour, haemopathy, HIV infection, immunological diseases, various inflammations and developmental disorders. The present sequence is a probe, which was used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Libonuclease H (RNase H) and/or a polyamine, useful for detecting nucleic acids of interest in a sample

then the
nucleic
not contain a scissile linkage, and if one nucleic acid is DNA, then the other is RNA. The methods are useful for (in)directly detecting nucleic acids of interest in a sample. They may be applied to short and long nucleic acids. The acceleration of rate reactions in gene detection assays, using RNase H and/or polyamines (under conditions of low salt concentration), produces a lower background and, therefore, a greater signal to noise ratio. Sequences ARX05903-914 represent oligonucleotide probes used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a probe used for determining the presence of an antibiotic resistant mecA gene in a biological sample. The method provides a means for the rapid detection, for both the prevention of transmission and treatment of, methicillin resistant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Probe mecA945-29A18P for detecting an antibiotic resistant mecA gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Method for determining the presence of an antibiotic resistant meca
gene in a sample – using a scissile link containing nucleic acid
probe for antibiotic resistant meca gene

AA265654 to AA269578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their uncleotide sequences. AA269579 to AA277440 represent amplification primers for the biallelic markers. The biallelic markers of the human penome, and in complex association studies and in romplex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-embl/NA2000.DAT:AAZ67285

The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interferons interleukins, proteins coupled receptors and thioesterases. The present sequence is G-protein coupled receptors and thioesterases. The present sequence is by them may be used in the prevention, diagnosis and treatment of by them may be used in the prevention, diagnosis and treatment of above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunosuppressive; immunostimulatory; antiinflammatory; cytostatic; neuroprotective; antimicrobial; gene therapy; vaccine; amylase; cancer; amyloid protein; anglopoietin; apoptosis related protein; cadherin; copyclin; polymerase; oncogene; histone; kinase; colony stimulating factor; complement related protein; cytochrome; kinase; cytokine; interferon; interleukin; G-protein coupled receptor; thioesterase; inflammation; multifactorial disease; autoimmune disease; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections -

Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonacleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 k range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the linsert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampliallin resistance."

A1223998 46 bp mRNA linear EST 21-DEC-1998 qx12h07.x1 NCI_CGAP_Lyml2 Homo sapiens CDNA clone IMAGE:2001181 3' similar to TR:Q04154 Q04154 SALIVARY PROLINE-RICH PROTEIN RP15 PRECURSOR.; contains element MER22 repetitive element; mRNA
analysis were selected following oligonucleotide hybridization fingerprinting of arrayed clones from Experish late somitogenesis (26.8s), adult liver or embryonic shield stage (5.6 h) libraries. Fingerprint data were used to computationally cluster cDNAs, and a single cDNA from each cluster was chosen for sequencing. In some cases multiple members of the same cluster were sequenced to assess clustering parameters or single clones were sequenced additional times to assess quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note-"organ: Tymph node; Vector: pCMV-SPORT6; Site_1: Sall; Site_2: NotI; Cloned unidirectionally.
